JewelOS coding setup vs gstack

Prepared 4 Nov 2026 · Sources: `CLAUDE.md`, `MODEL-POLICY.md`, `HANDOFF.md`, `.claude/`, `checks/`, `tests/`, git history, gstack README and skill list

> **Bottom line.** Your setup is already a full engineering process, built around one product and its failure history. gstack is a general-purpose version of the same idea: a team of role-based slash commands. They overlap on review, QA, security and shipping. Your setup is stronger where it knows JewelOS (bug families, one-JSON-blob rules, handoff between two Claudes). gstack is stronger on *planning* (product and design review before code) and *shipping* (PR, version bump, canary). Don't replace yours; borrow selectively.

1. Your setup, from prompt to result

Facts: 440 commits since 8 Sep 2026 · ~21,100 lines in `js/` (11 ES5 modules + `index.html`) · Cloudflare Worker host · Supabase Edge Functions backend.

1. **You prompt.** Plain language. `CLAUDE.md` loads automatically and tells Claude you are not a coder, so it must explain reasoning.
2. **Priority gate.** Claude asks: does this move JewelOS closer to sellable and to the late-September launch? If not, it says so before building.
3. **Read the shared notebook.** `HANDOFF.md` is read first. It is the only thing Claude Code and Cowork (the chat with the live database) both see. Claude claims the NOW line.
4. **Pick the model by risk.** `MODEL-POLICY.md`: Sonnet builds (default); Opus plans architecture, hard bugs, security, data integrity and final review. Risk is rated green / yellow / red.
5. **Safety checks on arrival.** `git status` and `git log`. A dirty tree means another session is mid-change: stop and ask. The repo folder is the only source of truth (no Downloads zips).
6. **Match a procedure.** `skills/jewelos-dev.md` (house rules, five recurring bug families) or `skills/verify-ui.md`.
7. **Write the code under hard rules.** ES5 only, `escHtml()` / `jsAttrEsc()`, `shopScopedKey()`, weight is derived, no rewrite of the Girvi interest engine, no new module file without sign-off.
8. **Hooks enforce rules automatically** (Claude cannot forget them): block new module files, block writes to secrets, syntax-check plus run the regression suite after every `js/` edit, and block ending the turn until the reviewer and test-runner agents have run.
9. **Route to agents** by a fixed table, no asking you: bug-pattern reviewer, test runner, invariant tester (sale/stock/billing/girvi/daybook), security auditor (auth/payment/RLS), deploy verifier, readiness auditor, handoff writer. Max two per task, except the four-agent pre-release checklist.
10. **Verify.** `check.bat`: `node --check` on all files, regression suite, nine AST scripts in `checks/`, then 10 Playwright e2e specs for touched areas. A git pre-commit hook runs the regression suite when code is staged.
11. **Be honest about gaps.** Claude must say what it could *not* verify. DOM behaviour outside the e2e list is unverified.
12. **Commit, deploy, verify live.** Build zipped from the repo; Cloudflare Worker deploy; `jewelos-deploy-verifier` checks the live origin before you are told it is live. Rollback tags (`batch66-live` etc.).
13. **Hand back.** Release NOW, append a numbered LOG entry ending with `→ FOR COWORK:` / `→ FOR TANISH:`. Latest: 130th entry (3 Nov).

2. How the coding has evolved to today

When	What changed
8 Sep	Folder became a git repo after two sessions edited the same batch in parallel and another nearly shipped a stale Downloads zip.
9 Sep	Model policy: Sonnet default, Opus for risk.
Sep–Oct	Batches 14–65: numbered CHANGES files, nine AST check scripts, regression suite (489 passing on 3 Nov), 10 e2e specs, Day Book module (the one sanctioned new module, 20 Sep).
Sep–Oct	Security work: store-proxy session-token auth, CORS fix, security review (14 Sep), stored-XSS remediation (done, live), Sentry.
Oct	Seven custom `jewelos-*` agents, four enforcement hooks, merged skills; HANDOFF condensed twice (5,667 lines to ~1,400).
27 Oct	Cloudflare Worker became the sole live host (Netlify retired).
30 Oct	Rule: `jewelos-*` agents beat generic reviewers on `js/` diffs.
31 Oct–3 Nov	batch67 (Karigar 2.0 phases 3–4) live; batch68 security headers committed, not deployed; backup rehearsal passed; Karigar 2.0 plan written, phases 5+ deferred until after launch.
4 Nov (today)	Added plugins: ponytail, caveman, Karpathy guidelines, taste-skill, gstack (personal install).

3. gstack in one paragraph

gstack (Garry Tan) is a set of ~50 Markdown slash-commands that turn Claude Code into a "virtual team": CEO, eng manager, designer, reviewer, QA lead, security officer, release engineer. Flow: **think** → **plan** → **build** → **review** → **test** → **ship** → **reflect**. It includes its own browser for QA. Installed here: version 1.95.5.0; `/cso` unavailable (needs C++ build tools). **Not yet run on JewelOS**; the comparison below is from its README and skill descriptions.

4. Side-by-side by stage

Stage	Your setup	gstack	Verdict
Think / idea	Priority gate in CLAUDE.md; Sprint Prioritizer agent	`/office-hours`, `/plan-ceo-review`, `/spec`	gstack deeper; yours is a one-line gate
Plan	Opus plans, Sonnet builds; written plans in `docs/superpowers/plans/`	`/autoplan`, `/plan-eng-review`, `/plan-design-review`	Similar; gstack adds design and DX review
Coding rules	ES5, escaping, scoped keys, derived weight, no new modules, enforced by hooks	Generic; none of your rules	**Yours.** gstack cannot know them
Code review	`jewelos-bug-pattern-reviewer` (five bug families), auto-forced by a Stop hook	`/review`, `/health`	**Yours** for JewelOS bugs; gstack for general sweeps
Business invariants	`jewelos-invariant-tester` (sale, stock, girvi, daybook, sync)	None	**Yours only**
Tests	Regression suite, 9 AST checks, 10 e2e specs, SQL tests, pre-commit hook	`/qa`, `/qa-only`, `/verify`, `/test-audit`	Yours is persistent and project-specific; `/qa` finds new bugs in a real browser
Security	`jewelos-security-auditor`, secret-write hook, security headers (batch68)	`/cso` (OWASP/STRIDE) — currently unavailable here	Yours works today; `/cso` needs build tools
Design / UI	Frontend Developer agent, verify-ui skill, taste-skill (new)	`/design-review`, `/design-html`, `/design-consultation`	gstack stronger
Ship	Manual: commit, `wrangler deploy`, deploy-verifier, rollback tags, only on your say-so	`/ship`, `/land-and-deploy`, `/canary`	Yours is cautious on purpose; gstack automates more
Memory / handoff	`HANDOFF.md` with mandatory hand-back lines; two-Claude coordination	`/context-save`, `/context-restore`, `/learn`	**Yours.** gstack has no Cowork equivalent
Safety guards	Hooks, deny rules, model policy, "dirty tree = stop"	`/careful`, `/freeze`, `/guard`	Comparable; gstack's are opt-in per session
Browsing	claude-in-chrome / Playwright	`/browse` (now mandated in CLAUDE.md)	Same job

Retrospective	HANDOFF LOG entries	`/retro`	Roughly equal

5. What to borrow, what to skip

Worth trying (in this order)

1. `/qa` on the live site or local build: real-browser bug finding, outside your 10 e2e specs. Needs `/browse` to work first; test it.
2. `/plan-design-review` and `/design-review`: your open findings are visual (9px text, 320px overflow, leftover emoji).
3. `/careful` or `/guard` during deploy and migration work (migration 010 is not applied; the service_role key needs rotating).
4. `/retro` before launch to summarise what slipped.

Skip or defer

- `/ship`, `/land-and-deploy`: they assume a PR flow and would bypass your "deploy only when Tanish says so" and HANDOFF rules.
- `/cso`: needs Visual Studio Build Tools; your security auditor already covers it.
- `/review`: overlaps your bug-pattern reviewer, and your CLAUDE.md says the `jewelos-*` agent wins on `js/` diffs.
- iOS, Codex, captain, gbrain skills: not relevant to a PWA.

6. Risks and what I could not verify

- **Rule clash:** CLAUDE.md allows at most two agents per task. gstack's multi-step skills may spawn more. Decide which wins before running `/autoplan`.
- **Rule clash:** gstack skills may write files or commit. Your HANDOFF/NOW claim and "dirty tree = stop" rules still apply.
- I read gstack's README and skill list but **did not run any gstack skill**. Capability claims are from its documentation, not tested on JewelOS. `/browse` is untested here.
- Counts (440 commits, ~21,100 lines, 489 tests) come from git, `wc` and the 129th HANDOFF entry; I did not re-run the test suite today.
- The service_role key exposed in an earlier chat still needs rotating (HANDOFF 129th entry).
